## Deployment Models Scope and Eligibility

This business area brings together Multi-tenant SaaS, Dedicated Tenant, Customer-managed On-premises. The grouping follows operational ownership and reader workflow; each subsection retains its own plan, version, status, limits, exceptions, and evidence.

| Topic                        | Capability state                   | Commercial scope             |
|------------------------------|------------------------------------|------------------------------|
| Multi-tenant SaaS            | standard capability                | Business                     |
| Dedicated Tenant             | Dedicated-only capability          | Dedicated                    |
| Customer-managed On-premises | standard or plan-limited as stated | Plan-specific; see fact rule |

### Multi-tenant SaaS

For multi-tenant saas, version 3.2 classifies the function as standard capability for Business. Its control record is reviewed every 365 days, operational evidence is sampled every 6 hours, and any approved exception expires after 35 days.

Eligibility for multi-tenant saas follows the current product register rather than feature-name similarity. The governing entry lists the state as standard capability and the customer scope as Business; region and deployment prerequisites still apply. Sales and implementation teams must preserve that boundary in every RFP response. A contradictory order form is quarantined for review by the service owner instead of being treated as an entitlement.

The operational workflow for multi-tenant saas assigns Product Operations to prepare the tenant record and a separate reviewer to confirm the live result. The verification is performed in Frankfurt; evidence is captured in a signed configuration export with the tenant and version identifiers. No production dependency may rely on the setting before that evidence is complete. Its maximum routine review interval is 365 days.

An exception for multi-tenant saas must name the unmet requirement, compensating control, accountable owner, and expiry date. The expiry may be no later than 35 days after approval, and renewal requires a fresh decision. Roadmap language and an unsigned services estimate are not compensating controls. At expiry, operations either restores the documented baseline or disables the dependent workflow.

Operational assurance for multi-tenant saas compares the live setting with the approved record every 6 hours during implementation. Drift is assigned to Product Operations with both values and the observation time attached. Until reconciliation, the evidence package reports the control as unresolved. Similar terminology elsewhere in the platform cannot be used as substitute proof.

Evidence for multi-tenant saas is delivered as a signed configuration export with immutable tenant and version references. It records the last successful test, responsible roles, region, numeric unit, and unresolved deviations. Customer content and credentials are excluded. Reviewers reject images or copied text that lack provenance and an effective-version marker.

Verification failure for multi-tenant saas suspends activation and any new operation that depends on the control, without rewriting previously committed evidence. Product Operations records impact, cause, correction, and retest results. Re-enablement requires the service owner's sign-off. Other service objectives remain governed by their own start times and are not recalculated from this recovery.

For multi-tenant saas, the customer provides correct tenant identifiers, maintains authorized contacts, and reports subscription or regional changes before production reliance. Customer-operated identity providers, key services, network appliances, integration platforms, and on-premises components remain customer dependencies. DealFlow operates the documented hosted boundary and supplies the signed configuration export for its portion.

Procurement responses for multi-tenant saas separate product availability from implementation effort. The response records standard capability, identifies Business, cites the effective subsection, and preserves every relevant unit and condition. Supporting evidence is named without exposing tenant secrets. If delivery depends on custom work, professional services, or a future roadmap item, that dependency appears prominently instead of being implied as live capability.

Consider a Business tenant enabled in Frankfurt. Its entitlement, live value, version, and evidence agree, so the assessor can accept multi-tenant saas. The same record cannot prove another capability. A later migration to Singapore triggers a new check and preserves the original result solely as audit history.

Evidence for multi-tenant saas is insufficient when an implementation team borrows a value from an adjacent policy. The adjacent deployment models control uses a 21-day window and applies to Enterprise; those values are not interchangeable. Official origin alone does not make two controls interchangeable. The review records the mismatch and withholds proposal approval until scope, version, status, and unit point to this exact rule.

Product governance publishes material revisions for multi-tenant saas 35 days in advance under normal conditions. Each notice links the outgoing and incoming rules, lists affected tenants, and explains migration and evidence updates. A security emergency may use an expedited path. Historical guidance is retained as superseded, while open exceptions keep their original expiry and are reconsidered against the new baseline.

Decision example 1. A customer in Frankfurt changes an implementation parameter that may affect multi-tenant saas. Regional Reliability verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 7 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 2. For a Virginia renewal, Customer Success must decide whether multi-tenant saas can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 14 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 3. A Singapore tenant asks whether multi-tenant saas remains contractually available after a configuration change. Platform Engineering checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 21 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 4. During a subscription review for a Sydney tenant, Product Operations compares the requested treatment of multi-tenant saas with the current entitlement and live configuration. Approval is time-bounded to 30 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 5. A customer in mainland China changes an implementation parameter that may affect multi-tenant saas. Security Assurance verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 35 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

## Dedicated Tenant

For dedicated tenant, version 3.2 classifies the function as Dedicated-only capability for Dedicated. Its control record is reviewed every 14 days, operational evidence is sampled every 8 hours, and any approved exception expires after 45 days.

For contracting purposes, dedicated tenant is evaluated against the effective guide and the tenant's recorded configuration. Its current state is Dedicated-only capability, with scope limited to Dedicated. Neither a demonstration environment nor a professional-services estimate expands production entitlement. The tenant security administrator must resolve any documentary conflict before the dependent control is enabled.

For dedicated tenant, Security Assurance creates the governing record before enablement, capturing tenant, subscription, authorized region, approval, and expected setting. A second operator validates the control in Virginia. Production use starts only when the tenant control report contains the expected value and a successful UTC timestamp. The record is reviewed every 14 days and whenever an edition, identity, network, or residency change could alter eligibility.

Temporary deviation from the dedicated tenant baseline is allowed only through a time-bounded exception owned by a named person. The record describes the exact gap, residual risk, monitoring action, and a deadline within 45 days.

Extensions are never automatic. If the deadline passes without renewed approval, the affected operation returns to baseline or is suspended.

For dedicated tenant, the verification job samples the configured state at an interval of 8 hours while rollout is active. Differences from the tenant registry produce an auditable investigation owned by Security Assurance; downstream attestations remain blocked. A passing result confirms only the rule in this subsection and carries no implication for controls with comparable names or numbers.

A valid assurance package for dedicated tenant combines the tenant control report, entitlement record, UTC verification result, approving role, and exception history. Redaction protects secrets and personal information but preserves every field needed to interpret applicability. Marketing material may explain the capability; it cannot replace tenant-specific operational evidence.

If verification of dedicated tenant fails, new dependent operations stop while committed records remain readable. Security Assurance determines whether the cause is drift, expired entitlement, regional restriction, or version mismatch. Restoration requires a clean verification and approval from the tenant security administrator. Recovery does not restart unrelated SLA, RTO, RPO, retention, or residency clocks.

Responsibility for dedicated tenant is shared at the documented service boundary. The customer keeps contacts, entitlement information, external systems, and requested regions accurate; DealFlow configures and verifies the hosted control. Availability of customer-managed infrastructure is not transferred to DealFlow. The provider's work is evidenced by the tenant control report.

When dedicated tenant appears in a customer questionnaire, the reviewer first gives a direct supported, conditional, custom, planned, deprecated, or unsupported conclusion. The explanation then identifies the Dedicated boundary, version, region assumptions, customer duties, and available evidence. Similar product names are not enough: the cited rule must answer the exact requirement and its measurement basis.

A valid procurement response can cite a Virginia implementation when the signed scope is Dedicated and the tenant control report identifies the effective release. Acceptance is limited to dedicated tenant. Changing the service region to Sydney invalidates prospective reliance on the old check until regional verification is repeated.

A common failure involving dedicated tenant is to combine old and current guidance or apply one subscription's value to another. The adjacent deployment models control uses a 30-day window and applies to Dedicated; those values are not interchangeable. The incorrect mapping is retained as review evidence, but it cannot support the customer commitment. Correction requires a citation to the effective rule and confirmation of the applicable tenant scope.

Material changes to dedicated tenant eligibility, numeric limits, regional coverage, or capability state are announced at least 45 days before effect unless an urgent security correction requires less notice. The notice names old and new values, affected subscriptions, migration action, and replacement document. Existing exceptions keep their expiry but are reassessed; historical text remains marked superseded.

Decision example 1. For a Virginia renewal, Customer Success must decide whether dedicated tenant can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 14 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 2. A Singapore tenant asks whether dedicated tenant remains contractually available after a configuration change. Platform Engineering checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 21 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 3. During a subscription review for a Sydney tenant, Product Operations compares the requested treatment of dedicated tenant with the current entitlement and live configuration. Approval is time-bounded to 30 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 4. A customer in mainland China changes an implementation parameter that may affect dedicated tenant. Security Assurance verifies the version, plan, region, state, unit, and exclusion before answering the procurement

team. A compliant result is reviewed again within 35 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 5. For a Frankfurt renewal, Regional Reliability must decide whether dedicated tenant can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 45 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

## Customer-managed On-premises

On-premises deployment is available only as a Dedicated custom engagement; it is not part of standard SaaS and the customer operates infrastructure and upgrades.

The commercial boundary for running the product inside the buyer's own data center is determined from the signed edition, deployment model, region, effective version, and recorded lifecycle state. In this release the applicable classification is standard or plan-limited as stated, and the recorded scope is Plan-specific; see fact rule. A proposal may describe a narrower customer commitment, but it cannot imply broader availability. If the order form conflicts with this guide, activation pauses until the regional operations lead records a written resolution.

Activation of running the product inside the buyer's own data center begins with a request owned by Regional Reliability. The request links the commercial entitlement, target environment, region, implementation parameters, and approver. Validation takes place in Singapore, and the resulting UTC-stamped change ticket must be attached before the feature is released to users. Routine reassessment occurs every 30 days as well as after any material tenant change.

Where the baseline for running the product inside the buyer's own data center cannot be met, the customer and Regional Reliability must document the reason, risk treatment, validation method, and responsible party. Approval lasts at most 60 days. A planned feature does not satisfy the missing control, and custom work is not considered delivered until accepted. Expired exceptions are closed by restoring compliance or removing the dependency.

During an active change window, evidence collection runs every 12 hours. It checks the approved tenant value, current platform value, region, and version. Any divergence is routed to Regional Reliability and shown as a failed control until resolved. Verification is deliberately scoped to running the product inside the buyer's own data center, so adjacent policies require their own evidence.

The customer-facing evidence package for running the product inside the buyer's own data center contains the UTC-stamped change ticket, effective version, activation time in UTC, approving role, latest result, and any open exception. Secrets, personal data, and raw customer content are redacted, while plan, region, state, threshold, and unit remain visible. A screenshot without tenant and version context is supporting material only, not authoritative proof.

A failed running the product inside the buyer's own data center check moves the control to a non-compliant state and blocks new use of the dependent function. Existing durable data is preserved unless its own policy requires removal. Regional Reliability diagnoses entitlement, configuration, region, and version in that order. Service resumes only after retest and regional operations lead approval; unrelated contractual timers continue unchanged.

For running the product inside the buyer's own data center, customers must disclose configuration and subscription changes, keep approval contacts current, and operate any external dependency under their control. DealFlow remains accountable for the hosted implementation described here and produces a UTC-stamped change ticket. This division prevents an external KMS, IdP, network, connector, or on-premises host from being mistaken for a provider-operated component.

The approved response pattern for running the product inside the buyer's own data center begins with its current state-standard or plan-limited as stated-and the applicable commercial scope-Plan-specific; see fact rule. It then states prerequisites, measurable behavior, evidence, exceptions, and ownership in separate sentences. Historical or neighboring values may be mentioned only as exclusions. This structure lets the proposal team answer precisely without converting ambiguity into a broader commitment.

A tenant within Plan-specific; see fact rule completes activation in Singapore and presents versioned evidence that matches the live setting. This supports the claim for running the product inside the buyer's own data center, but no broader claim. If deployment moves to mainland China, reviewers retain the old artifact for traceability and require fresh evidence before acceptance.

A non-conforming response for running the product inside the buyer's own data center cites a similarly named policy with a different number, lifecycle state, or subscription. Dedicated hosted tenancy is isolated but remains provider-operated. The neighboring statement answers another business condition even when both documents are official. The proposal must be corrected before approval, and the rejected interpretation remains in the audit trail.

The normal notice period for a material change to running the product inside the buyer's own data center is 60 days. Release communication must identify the previous rule, replacement, affected plans and regions, required customer action, and authoritative guide. Emergency security remediation may shorten notice with recorded justification. Open exceptions retain their dates and undergo a new applicability review.

Decision example 1. A Singapore tenant asks whether running the product inside the buyer's own data center remains contractually available after a configuration change. Platform Engineering checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 21 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 2. During a subscription review for a Sydney tenant, Product Operations compares the requested treatment of running the product inside the buyer's own data center with the current entitlement and live configuration. Approval is time-bounded to 30 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 3. A customer in mainland China changes an implementation parameter that may affect running the product inside the buyer's own data center. Security Assurance verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 35 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 4. For a Frankfurt renewal, Regional Reliability must decide whether running the product inside the buyer's own data center can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 45 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 5. A Virginia tenant asks whether running the product inside the buyer's own data center remains contractually available after a configuration change. Customer Success checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 60 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

## Deployment Models Configuration and Operations

This business area brings together Control Plane Placement, Data Plane Isolation, Upgrade Responsibility. The grouping follows operational ownership and reader workflow; each subsection retains its own plan, version, status, limits, exceptions, and evidence.

| Topic                   | Capability state           | Commercial scope         |
|-------------------------|----------------------------|--------------------------|
| Control Plane Placement | Enterprise-tier capability | Enterprise and Dedicated |
| Data Plane Isolation    | standard capability        | Business                 |
| Upgrade Responsibility  | Enterprise-only capability | Enterprise               |

### Control Plane Placement

For control plane placement, version 3.2 classifies the function as Enterprise-tier capability for Enterprise and Dedicated. Its control record is reviewed every 45 days, operational evidence is sampled every 24 hours, and any approved exception expires after 90 days.

Before committing to control plane placement, the account team verifies five fields: subscription, hosting model, data region, product version, and capability state. The authoritative record identifies Enterprise-tier capability for Enterprise and Dedicated. Contract language may add restrictions but may not convert a roadmap, custom, deprecated, or unsupported item into standard service. Ambiguity is escalated to the change advisory board before the response is approved.

To configure control plane placement, Customer Success verifies entitlement first and then records the environment-specific value. An independent operator tests the result in Sydney and stores a regional assurance workbook. A failed or incomplete test keeps production disabled. Successful configurations return to review every 45 days, with earlier review triggered by subscription, region, provider, or architecture changes.

Exception approval for control plane placement does not change the product's capability state. Each request identifies the specific condition, compensating safeguard, owner, verification evidence, and an expiry within 90 days. Renewal repeats the risk review from the beginning. Without a valid renewal, the documented default is enforced and any incompatible workflow stops.

While a change remains open, the service checks the active value every 24 hours against the tenant registry. A mismatch opens a case for Customer Success, preserves old and proposed values, and prevents the compliance export from reporting success. This result applies only to control plane placement; it does not certify a neighboring identity, logging, resilience, or integration control.

For control plane placement, auditors receive a regional assurance workbook that identifies the tenant, product version, region, approval, UTC observation time, and current exception status. Sensitive values are masked without removing the fields needed to assess scope. Stand-alone screenshots and sales slides cannot establish whether the control was current, historical, planned, custom, or unavailable.

When the observed value for control plane placement no longer matches the approved record, the platform prevents additional dependent actions and opens an incident for Customer Success. Investigation separates configuration drift from subscription or regional ineligibility. The change advisory board authorizes recovery after a successful test. The event cannot be used to reset separate availability, recovery, logging, or residency obligations.

The tenant owner supplies accurate identifiers, regions, authorized users, and information about externally managed components used by control plane placement. DealFlow validates only the platform boundary it operates and records that result in a regional assurance workbook. Failures in a customer-controlled identity, key, network, integration, or infrastructure service follow the customer's operating process unless a separate agreement states otherwise.

An RFP answer about control plane placement must state the effective version, applicable scope, operational owner, measurable limit or cadence, evidence type, and explicit exclusion. The answer should use Enterprise-tier capability as the lifecycle description and Enterprise and Dedicated as the commercial boundary. It must not combine values from adjacent sections. Any unresolved exception is disclosed with its expiry rather than presented as standard support.

In a conforming case, the order form matches Enterprise and Dedicated, the control is activated in Sydney, and the evidence names the current version. The assessor accepts the package for control plane placement only. If the tenant later moves to Frankfurt, the prior result remains historical and a new regional verification is required.

An invalid interpretation of control plane placement substitutes a nearby control because its terminology appears similar. The adjacent deployment models control uses a 45-day window and applies to Business; those values are not interchangeable. Differences in audience, version, state, unit, or time window are material. Reviewers reject the claim, preserve their rationale, and require the proposal owner to cite the authoritative subsection.

Changes to control plane placement scope, units, limits, regions, or lifecycle status follow a minimum 90-day communication window except for documented urgent security action. Customers receive a comparison of old and new rules plus migration instructions. Superseded language remains available for audit, and existing exceptions are reviewed without silently extending them.

Decision example 1. During a subscription review for a Sydney tenant, Product Operations compares the requested treatment of control plane placement with the current entitlement and live configuration. Approval is time-bounded to 30 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 2. A customer in mainland China changes an implementation parameter that may affect control plane placement. Security Assurance verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 35 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 3. For a Frankfurt renewal, Regional Reliability must decide whether control plane placement can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 45 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 4. A Virginia tenant asks whether control plane placement remains contractually available after a configuration change. Customer Success checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 60 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 5. During a subscription review for a Singapore tenant, Platform Engineering compares the requested treatment of control plane placement with the current entitlement and live configuration. Approval is time-bounded to 90 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

## Data Plane Isolation

For data plane isolation, version 3.2 classifies the function as standard capability for Business. Its control record is reviewed every 90 days, operational evidence is sampled every 48 hours, and any approved exception expires after 120 days.

Eligibility for isolating a tenant's runtime data plane follows the current product register rather than feature-name similarity. The governing entry lists the state as standard capability and the customer scope as Business; region and deployment prerequisites still apply. Sales and implementation teams must preserve that boundary in every RFP response. A contradictory order form is quarantined for review by the data protection officer instead of being treated as an entitlement.

The operational workflow for isolating a tenant's runtime data plane assigns Platform Engineering to prepare the tenant record and a separate reviewer to confirm the live result. The verification is performed in mainland China; evidence is captured in a machine-readable audit bundle with the tenant and version identifiers. No production dependency may rely on the setting before that evidence is complete. Its maximum routine review interval is 90 days.

An exception for isolating a tenant's runtime data plane must name the unmet requirement, compensating control, accountable owner, and expiry date. The expiry may be no later than 120 days after approval, and renewal requires a fresh decision. Roadmap language and an unsigned services estimate are not compensating controls. At expiry, operations either restores the documented baseline or disables the dependent workflow.

Operational assurance for isolating a tenant's runtime data plane compares the live setting with the approved record every 48 hours during implementation. Drift is assigned to Platform Engineering with both values and the observation time attached. Until reconciliation, the evidence package reports the control as unresolved. Similar terminology elsewhere in the platform cannot be used as substitute proof.

Evidence for isolating a tenant's runtime data plane is delivered as a machine-readable audit bundle with immutable tenant and version references. It records the last successful test, responsible roles, region, numeric unit, and unresolved deviations. Customer content and credentials are excluded. Reviewers reject images or copied text that lack provenance and an effective-version marker.

Verification failure for isolating a tenant's runtime data plane suspends activation and any new operation that depends on the control, without rewriting previously committed evidence. Platform Engineering records impact, cause, correction, and retest results. Re-enablement requires the data protection officer's sign-off. Other service objectives remain governed by their own start times and are not recalculated from this recovery.

For isolating a tenant's runtime data plane, the customer provides correct tenant identifiers, maintains authorized contacts, and reports subscription or regional changes before production reliance. Customer-operated identity providers, key services, network appliances, integration platforms, and on-premises components remain customer dependencies. DealFlow operates the documented hosted boundary and supplies the machine-readable audit bundle for its portion.

Procurement responses for isolating a tenant's runtime data plane separate product availability from implementation effort. The response records standard capability, identifies Business, cites the effective subsection, and preserves every relevant unit and condition. Supporting evidence is named without exposing tenant secrets. If delivery depends on custom work, professional services, or a future roadmap item, that dependency appears prominently instead of being implied as live capability.

Consider a Business tenant enabled in mainland China. Its entitlement, live value, version, and evidence agree, so the assessor can accept isolating a tenant's runtime data plane. The same record cannot prove another capability. A later migration to Virginia triggers a new check and preserves the original result solely as audit history.

Evidence for isolating a tenant's runtime data plane is insufficient when an implementation team borrows a value from an adjacent policy. The adjacent deployment models control uses a 60-day window and applies to Enterprise; those values are not interchangeable. Official origin alone does not make two controls interchangeable. The review records the mismatch and withholds proposal approval until scope, version, status, and unit point to this exact rule.

Product governance publishes material revisions for isolating a tenant's runtime data plane 120 days in advance under normal conditions. Each notice links the outgoing and incoming rules, lists affected tenants, and explains migration and evidence updates. A security emergency may use an expedited path. Historical guidance is retained as superseded, while open exceptions keep their original expiry and are reconsidered against the new baseline.

Decision example 1. A customer in mainland China changes an implementation parameter that may affect isolating a tenant's runtime data plane. Security Assurance verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 35 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 2. For a Frankfurt renewal, Regional Reliability must decide whether isolating a tenant's runtime data plane can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 45 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 3. A Virginia tenant asks whether isolating a tenant's runtime data plane remains contractually available after a configuration change. Customer Success checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 60 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 4. During a subscription review for a Singapore tenant, Platform Engineering compares the requested treatment of isolating a tenant's runtime data plane with the current entitlement and live configuration. Approval is time-bounded to 90 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 5. A customer in Sydney changes an implementation parameter that may affect isolating a tenant's runtime data plane. Product Operations verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 120 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

## Upgrade Responsibility

For upgrade responsibility, version 3.2 classifies the function as Enterprise-only capability for Enterprise. Its control record is reviewed every 180 days, operational evidence is sampled every 72 hours, and any approved exception expires after 180 days.

For contracting purposes, upgrade division of operational duties is evaluated against the effective guide and the tenant's recorded configuration. Its current state is Enterprise-only capability, with scope limited to Enterprise. Neither a demonstration environment nor a professional-services estimate expands production entitlement. The service owner must resolve any documentary conflict before the dependent control is enabled.

For upgrade division of operational duties, Product Operations creates the governing record before enablement, capturing tenant, subscription, authorized region, approval, and expected setting. A second operator validates the control in Frankfurt. Production use starts only when the signed configuration export contains the expected value and a successful UTC timestamp. The record is reviewed every 180 days and whenever an edition, identity, network, or residency change could alter eligibility.

Temporary deviation from the upgrade division of operational duties baseline is allowed only through a time-bounded exception owned by a named person. The record describes the exact gap, residual risk, monitoring action, and a deadline within 180 days. Extensions are never automatic. If the deadline passes without renewed approval, the affected operation returns to baseline or is suspended.

For upgrade division of operational duties, the verification job samples the configured state at an interval of 72 hours while rollout is active. Differences from the tenant registry produce an auditable investigation owned by Product Operations; downstream attestations remain blocked. A passing result confirms only the rule in this subsection and carries no implication for controls with comparable names or numbers.

A valid assurance package for upgrade division of operational duties combines the signed configuration export, entitlement record, UTC verification result, approving role, and exception history. Redaction protects secrets and personal information but preserves every field needed to interpret applicability. Marketing material may explain the capability; it cannot replace tenant-specific operational evidence.

If verification of upgrade division of operational duties fails, new dependent operations stop while committed records remain readable. Product Operations determines whether the cause is drift, expired entitlement, regional restriction, or version mismatch. Restoration requires a clean verification and approval from the service owner. Recovery does not restart unrelated SLA, RTO, RPO, retention, or residency clocks.

Responsibility for upgrade division of operational duties is shared at the documented service boundary. The customer keeps contacts, entitlement information, external systems, and requested regions accurate; DealFlow configures and verifies the hosted control. Availability of customer-managed infrastructure is not transferred to DealFlow. The provider's work is evidenced by the signed configuration export.

When upgrade division of operational duties appears in a customer questionnaire, the reviewer first gives a direct supported, conditional, custom, planned, deprecated, or unsupported conclusion. The explanation then identifies the Enterprise boundary, version, region assumptions, customer duties, and available evidence. Similar product names are not enough: the cited rule must answer the exact requirement and its measurement basis.

A valid procurement response can cite a Frankfurt implementation when the signed scope is Enterprise and the signed configuration export identifies the effective release. Acceptance is limited to upgrade division of operational duties. Changing the service region to Singapore invalidates prospective reliance on the old check until regional verification is repeated.

A common failure involving upgrade division of operational duties is to combine old and current guidance or apply one subscription's value to another. The adjacent deployment models control uses a 90-day window and applies to Dedicated;

those values are not interchangeable. The incorrect mapping is retained as review evidence, but it cannot support the customer commitment. Correction requires a citation to the effective rule and confirmation of the applicable tenant scope.

Material changes to upgrade division of operational duties eligibility, numeric limits, regional coverage, or capability state are announced at least 180 days before effect unless an urgent security correction requires less notice. The notice names old and new values, affected subscriptions, migration action, and replacement document. Existing exceptions keep their expiry but are reassessed; historical text remains marked superseded.

Decision example 1. For a Frankfurt renewal, Regional Reliability must decide whether upgrade division of operational duties can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 45 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 2. A Virginia tenant asks whether upgrade division of operational duties remains contractually available after a configuration change. Customer Success checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 60 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 3. During a subscription review for a Singapore tenant, Platform Engineering compares the requested treatment of upgrade division of operational duties with the current entitlement and live configuration. Approval is time-bounded to 90 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 4. A customer in Sydney changes an implementation parameter that may affect upgrade division of operational duties. Product Operations verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 120 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 5. For a mainland China renewal, Security Assurance must decide whether upgrade division of operational duties can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 180 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

## Deployment Models Limits and Exception Handling

This business area brings together Scaling Responsibility, Custom Components, Operational Access. The grouping follows operational ownership and reader workflow; each subsection retains its own plan, version, status, limits, exceptions, and evidence.

| Topic                  | Capability state          | Commercial scope         |
|------------------------|---------------------------|--------------------------|
| Scaling Responsibility | Dedicated-only capability | Dedicated                |
| Custom Components      | custom-development option | Enterprise and Dedicated |
| Operational Access     | standard capability       | Business                 |

### Scaling Responsibility

For scaling responsibility, version 3.2 classifies the function as Dedicated-only capability for Dedicated. Its control record is reviewed every 7 days, operational evidence is sampled every 1 hour, and any approved exception expires after 365 days.

The commercial boundary for scaling division of operational duties is determined from the signed edition, deployment model, region, effective version, and recorded lifecycle state. In this release the applicable classification is Dedicated-only capability, and the recorded scope is Dedicated. A proposal may describe a narrower customer commitment, but it cannot imply broader availability. If the order form conflicts with this guide, activation pauses until the tenant security administrator records a written resolution.

Activation of scaling division of operational duties begins with a request owned by Security Assurance. The request links the commercial entitlement, target environment, region, implementation parameters, and approver. Validation takes place in Virginia, and the resulting tenant control report must be attached before the feature is released to users. Routine reassessment occurs every 7 days as well as after any material tenant change.

Where the baseline for scaling division of operational duties cannot be met, the customer and Security Assurance must document the reason, risk treatment, validation method, and responsible party. Approval lasts at most 365 days. A planned feature does not satisfy the missing control, and custom work is not considered delivered until accepted. Expired exceptions are closed by restoring compliance or removing the dependency.

During an active change window, evidence collection runs every 1 hour. It checks the approved tenant value, current platform value, region, and version. Any divergence is routed to Security Assurance and shown as a failed control until resolved. Verification is deliberately scoped to scaling division of operational duties, so adjacent policies require their own evidence.

The customer-facing evidence package for scaling division of operational duties contains the tenant control report, effective version, activation time in UTC, approving role, latest result, and any open exception. Secrets, personal data, and raw customer content are redacted, while plan, region, state, threshold, and unit remain visible. A screenshot without tenant and version context is supporting material only, not authoritative proof.

A failed scaling division of operational duties check moves the control to a non-compliant state and blocks new use of the dependent function. Existing durable data is preserved unless its own policy requires removal. Security Assurance diagnoses entitlement, configuration, region, and version in that order. Service resumes only after retest and tenant security administrator approval; unrelated contractual timers continue unchanged.

For scaling division of operational duties, customers must disclose configuration and subscription changes, keep approval contacts current, and operate any external dependency under their control. DealFlow remains accountable for the hosted implementation described here and produces a tenant control report. This division prevents an external KMS, IdP, network, connector, or on-premises host from being mistaken for a provider-operated component.

The approved response pattern for scaling division of operational duties begins with its current state-Dedicated-only capability-and the applicable commercial scope-Dedicated. It then states prerequisites, measurable behavior, evidence, exceptions, and ownership in separate sentences. Historical or neighboring values may be mentioned only as exclusions. This structure lets the proposal team answer precisely without converting ambiguity into a broader commitment.

A tenant within Dedicated completes activation in Virginia and presents versioned evidence that matches the live setting. This supports the claim for scaling division of operational duties, but no broader claim. If deployment moves to Sydney, reviewers retain the old artifact for traceability and require fresh evidence before acceptance.

A non-conforming response for scaling division of operational duties cites a similarly named policy with a different number, lifecycle state, or subscription. The adjacent deployment models control uses a 120-day window and applies to Enterprise and Dedicated; those values are not interchangeable. The neighboring statement answers another business condition even when both documents are official. The proposal must be corrected before approval, and the rejected interpretation remains in the audit trail.

The normal notice period for a material change to scaling division of operational duties is 365 days. Release communication must identify the previous rule, replacement, affected plans and regions, required customer action, and authoritative guide. Emergency security remediation may shorten notice with recorded justification. Open exceptions retain their dates and undergo a new applicability review.

Decision example 1. A Virginia tenant asks whether scaling division of operational duties remains contractually available after a configuration change. Customer Success checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 60 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 2. During a subscription review for a Singapore tenant, Platform Engineering compares the requested treatment of scaling division of operational duties with the current entitlement and live configuration. Approval is time-bounded to 90 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 3. A customer in Sydney changes an implementation parameter that may affect scaling division of operational duties. Product Operations verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 120 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 4. For a mainland China renewal, Security Assurance must decide whether scaling division of operational duties can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 180 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 5. A Frankfurt tenant asks whether scaling division of operational duties remains contractually available after a configuration change. Regional Reliability checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 365 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

## Custom Components

For custom components, version 3.2 classifies the function as custom-development option for Enterprise and Dedicated. Its control record is reviewed every 21 days, operational evidence is sampled every 2 hours, and any approved exception expires after 7 days.

Before committing to custom components, the account team verifies five fields: subscription, hosting model, data region, product version, and capability state. The authoritative record identifies custom-development option for Enterprise and Dedicated. Contract language may add restrictions but may not convert a roadmap, custom, deprecated, or unsupported item into standard service. Ambiguity is escalated to the regional operations lead before the response is approved.

To configure custom components, Regional Reliability verifies entitlement first and then records the environment-specific value. An independent operator tests the result in Singapore and stores a UTC-stamped change ticket. A failed or incomplete test keeps production disabled. Successful configurations return to review every 21 days, with earlier review triggered by subscription, region, provider, or architecture changes.

Exception approval for custom components does not change the product's capability state. Each request identifies the specific condition, compensating safeguard, owner, verification evidence, and an expiry within 7 days. Renewal repeats

the risk review from the beginning. Without a valid renewal, the documented default is enforced and any incompatible workflow stops.

While a change remains open, the service checks the active value every 2 hours against the tenant registry. A mismatch opens a case for Regional Reliability, preserves old and proposed values, and prevents the compliance export from reporting success. This result applies only to custom components; it does not certify a neighboring identity, logging, resilience, or integration control.

For custom components, auditors receive a UTC-stamped change ticket that identifies the tenant, product version, region, approval, UTC observation time, and current exception status. Sensitive values are masked without removing the fields needed to assess scope. Stand-alone screenshots and sales slides cannot establish whether the control was current, historical, planned, custom, or unavailable.

When the observed value for custom components no longer matches the approved record, the platform prevents additional dependent actions and opens an incident for Regional Reliability. Investigation separates configuration drift from subscription or regional ineligibility. The regional operations lead authorizes recovery after a successful test. The event cannot be used to reset separate availability, recovery, logging, or residency obligations.

The tenant owner supplies accurate identifiers, regions, authorized users, and information about externally managed components used by custom components. DealFlow validates only the platform boundary it operates and records that result in a UTC-stamped change ticket. Failures in a customer-controlled identity, key, network, integration, or infrastructure service follow the customer's operating process unless a separate agreement states otherwise.

An RFP answer about custom components must state the effective version, applicable scope, operational owner, measurable limit or cadence, evidence type, and explicit exclusion. The answer should use custom-development option as the lifecycle description and Enterprise and Dedicated as the commercial boundary. It must not combine values from adjacent sections. Any unresolved exception is disclosed with its expiry rather than presented as standard support.

In a conforming case, the order form matches Enterprise and Dedicated, the control is activated in Singapore, and the evidence names the current version. The assessor accepts the package for custom components only. If the tenant later moves to mainland China, the prior result remains historical and a new regional verification is required.

An invalid interpretation of custom components substitutes a nearby control because its terminology appears similar. The adjacent deployment models control uses a 180-day window and applies to Business; those values are not interchangeable. Differences in audience, version, state, unit, or time window are material. Reviewers reject the claim, preserve their rationale, and require the proposal owner to cite the authoritative subsection.

Changes to custom components scope, units, limits, regions, or lifecycle status follow a minimum 7-day communication window except for documented urgent security action. Customers receive a comparison of old and new rules plus migration instructions. Superseded language remains available for audit, and existing exceptions are reviewed without silently extending them.

Decision example 1. During a subscription review for a Singapore tenant, Platform Engineering compares the requested treatment of custom components with the current entitlement and live configuration. Approval is time-bounded to 90 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 2. A customer in Sydney changes an implementation parameter that may affect custom components. Product Operations verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 120 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 3. For a mainland China renewal, Security Assurance must decide whether custom components can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 180 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 4. A Frankfurt tenant asks whether custom components remains contractually available after a configuration change. Regional Reliability checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 365 days before routine reassessment; otherwise it is recorded

accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 5. During a subscription review for a Virginia tenant, Customer Success compares the requested treatment of custom components with the current entitlement and live configuration. Approval is time-bounded to 7 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

## Operational Access

For operational access, version 3.2 classifies the function as standard capability for Business. Its control record is reviewed every 35 days, operational evidence is sampled every 4 hours, and any approved exception expires after 14 days.

Eligibility for operational access follows the current product register rather than feature-name similarity. The governing entry lists the state as standard capability and the customer scope as Business; region and deployment prerequisites still apply. Sales and implementation teams must preserve that boundary in every RFP response. A contradictory order form is quarantined for review by the change advisory board instead of being treated as an entitlement.

The operational workflow for operational access assigns Customer Success to prepare the tenant record and a separate reviewer to confirm the live result. The verification is performed in Sydney; evidence is captured in a regional assurance workbook with the tenant and version identifiers. No production dependency may rely on the setting before that evidence is complete. Its maximum routine review interval is 35 days.

An exception for operational access must name the unmet requirement, compensating control, accountable owner, and expiry date. The expiry may be no later than 14 days after approval, and renewal requires a fresh decision. Roadmap language and an unsigned services estimate are not compensating controls. At expiry, operations either restores the documented baseline or disables the dependent workflow.

Operational assurance for operational access compares the live setting with the approved record every 4 hours during implementation. Drift is assigned to Customer Success with both values and the observation time attached. Until reconciliation, the evidence package reports the control as unresolved. Similar terminology elsewhere in the platform cannot be used as substitute proof.

Evidence for operational access is delivered as a regional assurance workbook with immutable tenant and version references. It records the last successful test, responsible roles, region, numeric unit, and unresolved deviations. Customer content and credentials are excluded. Reviewers reject images or copied text that lack provenance and an effective-version marker.

Verification failure for operational access suspends activation and any new operation that depends on the control, without rewriting previously committed evidence. Customer Success records impact, cause, correction, and retest results. Re-enablement requires the change advisory board's sign-off. Other service objectives remain governed by their own start times and are not recalculated from this recovery.

For operational access, the customer provides correct tenant identifiers, maintains authorized contacts, and reports subscription or regional changes before production reliance. Customer-operated identity providers, key services, network appliances, integration platforms, and on-premises components remain customer dependencies. DealFlow operates the documented hosted boundary and supplies the regional assurance workbook for its portion.

Procurement responses for operational access separate product availability from implementation effort. The response records standard capability, identifies Business, cites the effective subsection, and preserves every relevant unit and condition. Supporting evidence is named without exposing tenant secrets. If delivery depends on custom work, professional services, or a future roadmap item, that dependency appears prominently instead of being implied as live capability.

Consider a Business tenant enabled in Sydney. Its entitlement, live value, version, and evidence agree, so the assessor can accept operational access. The same record cannot prove another capability. A later migration to Frankfurt triggers a new check and preserves the original result solely as audit history.

Evidence for operational access is insufficient when an implementation team borrows a value from an adjacent policy. The adjacent deployment models control uses a 365-day window and applies to Enterprise; those values are not interchangeable. Official origin alone does not make two controls interchangeable. The review records the mismatch and withholds proposal approval until scope, version, status, and unit point to this exact rule.

Product governance publishes material revisions for operational access 14 days in advance under normal conditions. Each notice links the outgoing and incoming rules, lists affected tenants, and explains migration and evidence updates. A security emergency may use an expedited path. Historical guidance is retained as superseded, while open exceptions keep their original expiry and are reconsidered against the new baseline.

Decision example 1. A customer in Sydney changes an implementation parameter that may affect operational access. Product Operations verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 120 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 2. For a mainland China renewal, Security Assurance must decide whether operational access can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 180 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 3. A Frankfurt tenant asks whether operational access remains contractually available after a configuration change. Regional Reliability checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 365 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 4. During a subscription review for a Virginia tenant, Customer Success compares the requested treatment of operational access with the current entitlement and live configuration. Approval is time-bounded to 7 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 5. A customer in Singapore changes an implementation parameter that may affect operational access. Platform Engineering verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 14 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

## Deployment Models Evidence and Lifecycle Assurance

This business area brings together Environment Promotion, Air-gapped Boundary, Deployment Eligibility. The grouping follows operational ownership and reader workflow; each subsection retains its own plan, version, status, limits, exceptions, and evidence.

| Topic                  | Capability state           | Commercial scope         |
|------------------------|----------------------------|--------------------------|
| Environment Promotion  | Enterprise-only capability | Enterprise               |
| Air-gapped Boundary    | Dedicated-only capability  | Dedicated                |
| Deployment Eligibility | Enterprise-tier capability | Enterprise and Dedicated |

### Environment Promotion

For environment promotion, version 3.2 classifies the function as Enterprise-only capability for Enterprise. Its control record is reviewed every 60 days, operational evidence is sampled every 6 hours, and any approved exception expires after 21 days.

For contracting purposes, environment promotion is evaluated against the effective guide and the tenant's recorded configuration. Its current state is Enterprise-only capability, with scope limited to Enterprise. Neither a demonstration environment nor a professional-services estimate expands production entitlement. The data protection officer must resolve any documentary conflict before the dependent control is enabled.

For environment promotion, Platform Engineering creates the governing record before enablement, capturing tenant, subscription, authorized region, approval, and expected setting. A second operator validates the control in mainland China. Production use starts only when the machine-readable audit bundle contains the expected value and a successful UTC timestamp. The record is reviewed every 60 days and whenever an edition, identity, network, or residency change could alter eligibility.

Temporary deviation from the environment promotion baseline is allowed only through a time-bounded exception owned by a named person. The record describes the exact gap, residual risk, monitoring action, and a deadline within 21 days. Extensions are never automatic. If the deadline passes without renewed approval, the affected operation returns to baseline or is suspended.

For environment promotion, the verification job samples the configured state at an interval of 6 hours while rollout is active. Differences from the tenant registry produce an auditable investigation owned by Platform Engineering; downstream attestations remain blocked. A passing result confirms only the rule in this subsection and carries no implication for controls with comparable names or numbers.

A valid assurance package for environment promotion combines the machine-readable audit bundle, entitlement record, UTC verification result, approving role, and exception history. Redaction protects secrets and personal information but preserves every field needed to interpret applicability. Marketing material may explain the capability; it cannot replace tenant-specific operational evidence.

If verification of environment promotion fails, new dependent operations stop while committed records remain readable. Platform Engineering determines whether the cause is drift, expired entitlement, regional restriction, or version mismatch. Restoration requires a clean verification and approval from the data protection officer. Recovery does not restart unrelated SLA, RTO, RPO, retention, or residency clocks.

Responsibility for environment promotion is shared at the documented service boundary. The customer keeps contacts, entitlement information, external systems, and requested regions accurate; DealFlow configures and verifies the hosted control. Availability of customer-managed infrastructure is not transferred to DealFlow. The provider's work is evidenced by the machine-readable audit bundle.

When environment promotion appears in a customer questionnaire, the reviewer first gives a direct supported, conditional, custom, planned, deprecated, or unsupported conclusion. The explanation then identifies the Enterprise boundary, version, region assumptions, customer duties, and available evidence. Similar product names are not enough: the cited rule must answer the exact requirement and its measurement basis.

A valid procurement response can cite a mainland China implementation when the signed scope is Enterprise and the machine-readable audit bundle identifies the effective release. Acceptance is limited to environment promotion. Changing the service region to Virginia invalidates prospective reliance on the old check until regional verification is repeated.

A common failure involving environment promotion is to combine old and current guidance or apply one subscription's value to another. The adjacent deployment models control uses a 7-day window and applies to Dedicated; those values are not interchangeable. The incorrect mapping is retained as review evidence, but it cannot support the customer commitment. Correction requires a citation to the effective rule and confirmation of the applicable tenant scope.

Material changes to environment promotion eligibility, numeric limits, regional coverage, or capability state are announced at least 21 days before effect unless an urgent security correction requires less notice. The notice names old and new values, affected subscriptions, migration action, and replacement document. Existing exceptions keep their expiry but are reassessed; historical text remains marked superseded.

Decision example 1. For a mainland China renewal, Security Assurance must decide whether environment promotion can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 180 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 2. A Frankfurt tenant asks whether environment promotion remains contractually available after a configuration change. Regional Reliability checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 365 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 3. During a subscription review for a Virginia tenant, Customer Success compares the requested treatment of environment promotion with the current entitlement and live configuration. Approval is time-bounded to 7 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 4. A customer in Singapore changes an implementation parameter that may affect environment promotion. Platform Engineering verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 14 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 5. For a Sydney renewal, Product Operations must decide whether environment promotion can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 21 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

## Air-gapped Boundary

For air-gapped boundary, version 3.2 classifies the function as Dedicated-only capability for Dedicated. Its control record is reviewed every 120 days, operational evidence is sampled every 8 hours, and any approved exception expires after 30 days.

The commercial boundary for air-gapped boundary is determined from the signed edition, deployment model, region, effective version, and recorded lifecycle state. In this release the applicable classification is Dedicated-only capability, and the recorded scope is Dedicated. A proposal may describe a narrower customer commitment, but it cannot imply broader availability. If the order form conflicts with this guide, activation pauses until the service owner records a written resolution.

Activation of air-gapped boundary begins with a request owned by Product Operations. The request links the commercial entitlement, target environment, region, implementation parameters, and approver. Validation takes place in Frankfurt, and the resulting signed configuration export must be attached before the feature is released to users. Routine reassessment occurs every 120 days as well as after any material tenant change.

Where the baseline for air-gapped boundary cannot be met, the customer and Product Operations must document the reason, risk treatment, validation method, and responsible party. Approval lasts at most 30 days. A planned feature does not satisfy the missing control, and custom work is not considered delivered until accepted. Expired exceptions are closed by restoring compliance or removing the dependency.

During an active change window, evidence collection runs every 8 hours. It checks the approved tenant value, current platform value, region, and version. Any divergence is routed to Product Operations and shown as a failed control until resolved. Verification is deliberately scoped to air-gapped boundary, so adjacent policies require their own evidence.

The customer-facing evidence package for air-gapped boundary contains the signed configuration export, effective version, activation time in UTC, approving role, latest result, and any open exception. Secrets, personal data, and raw customer content are redacted, while plan, region, state, threshold, and unit remain visible. A screenshot without tenant and version context is supporting material only, not authoritative proof.

A failed air-gapped boundary check moves the control to a non-compliant state and blocks new use of the dependent function. Existing durable data is preserved unless its own policy requires removal. Product Operations diagnoses entitlement, configuration, region, and version in that order. Service resumes only after retest and service owner approval; unrelated contractual timers continue unchanged.

For air-gapped boundary, customers must disclose configuration and subscription changes, keep approval contacts current, and operate any external dependency under their control. DealFlow remains accountable for the hosted implementation described here and produces a signed configuration export. This division prevents an external KMS, IdP, network, connector, or on-premises host from being mistaken for a provider-operated component.

The approved response pattern for air-gapped boundary begins with its current state-Dedicated-only capability-and the applicable commercial scope-Dedicated. It then states prerequisites, measurable behavior, evidence, exceptions, and ownership in separate sentences. Historical or neighboring values may be mentioned only as exclusions. This structure lets the proposal team answer precisely without converting ambiguity into a broader commitment.

A tenant within Dedicated completes activation in Frankfurt and presents versioned evidence that matches the live setting. This supports the claim for air-gapped boundary, but no broader claim. If deployment moves to Singapore, reviewers retain the old artifact for traceability and require fresh evidence before acceptance.

A non-conforming response for air-gapped boundary cites a similarly named policy with a different number, lifecycle state, or subscription. The adjacent deployment models control uses a 14-day window and applies to Enterprise and Dedicated; those values are not interchangeable. The neighboring statement answers another business condition even when both documents are official. The proposal must be corrected before approval, and the rejected interpretation remains in the audit trail.

The normal notice period for a material change to air-gapped boundary is 30 days. Release communication must identify the previous rule, replacement, affected plans and regions, required customer action, and authoritative guide. Emergency security remediation may shorten notice with recorded justification. Open exceptions retain their dates and undergo a new applicability review.

Decision example 1. A Frankfurt tenant asks whether air-gapped boundary remains contractually available after a configuration change. Regional Reliability checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 365 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 2. During a subscription review for a Virginia tenant, Customer Success compares the requested treatment of air-gapped boundary with the current entitlement and live configuration. Approval is time-bounded to 7 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 3. A customer in Singapore changes an implementation parameter that may affect air-gapped boundary. Platform Engineering verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 14 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 4. For a Sydney renewal, Product Operations must decide whether air-gapped boundary can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 21 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 5. A mainland China tenant asks whether air-gapped boundary remains contractually available after a configuration change. Security Assurance checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 30 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

## Deployment Eligibility

For deployment eligibility, version 3.2 classifies the function as Enterprise-tier capability for Enterprise and Dedicated. Its control record is reviewed every 365 days, operational evidence is sampled every 12 hours, and any approved exception expires after 35 days.

Before committing to deployment eligibility, the account team verifies five fields: subscription, hosting model, data region, product version, and capability state. The authoritative record identifies Enterprise-tier capability for Enterprise and Dedicated. Contract language may add restrictions but may not convert a roadmap, custom, deprecated, or unsupported item into standard service. Ambiguity is escalated to the tenant security administrator before the response is approved.

To configure deployment eligibility, Security Assurance verifies entitlement first and then records the environment-specific value. An independent operator tests the result in Virginia and stores a tenant control report. A failed or incomplete test keeps production disabled. Successful configurations return to review every 365 days, with earlier review triggered by subscription, region, provider, or architecture changes.

Exception approval for deployment eligibility does not change the product's capability state. Each request identifies the specific condition, compensating safeguard, owner, verification evidence, and an expiry within 35 days. Renewal repeats the risk review from the beginning. Without a valid renewal, the documented default is enforced and any incompatible workflow stops.

While a change remains open, the service checks the active value every 12 hours against the tenant registry. A mismatch opens a case for Security Assurance, preserves old and proposed values, and prevents the compliance export from reporting success. This result applies only to deployment eligibility; it does not certify a neighboring identity, logging, resilience, or integration control.

For deployment eligibility, auditors receive a tenant control report that identifies the tenant, product version, region, approval, UTC observation time, and current exception status. Sensitive values are masked without removing the fields needed to assess scope. Stand-alone screenshots and sales slides cannot establish whether the control was current, historical, planned, custom, or unavailable.

When the observed value for deployment eligibility no longer matches the approved record, the platform prevents additional dependent actions and opens an incident for Security Assurance. Investigation separates configuration drift from subscription or regional ineligibility. The tenant security administrator authorizes recovery after a successful test. The event cannot be used to reset separate availability, recovery, logging, or residency obligations.

The tenant owner supplies accurate identifiers, regions, authorized users, and information about externally managed components used by deployment eligibility. DealFlow validates only the platform boundary it operates and records that result in a tenant control report. Failures in a customer-controlled identity, key, network, integration, or infrastructure service follow the customer's operating process unless a separate agreement states otherwise.

An RFP answer about deployment eligibility must state the effective version, applicable scope, operational owner, measurable limit or cadence, evidence type, and explicit exclusion. The answer should use Enterprise-tier capability as the lifecycle description and Enterprise and Dedicated as the commercial boundary. It must not combine values from adjacent sections. Any unresolved exception is disclosed with its expiry rather than presented as standard support.

In a conforming case, the order form matches Enterprise and Dedicated, the control is activated in Virginia, and the evidence names the current version. The assessor accepts the package for deployment eligibility only. If the tenant later moves to Sydney, the prior result remains historical and a new regional verification is required.

An invalid interpretation of deployment eligibility substitutes a nearby control because its terminology appears similar. The adjacent deployment models control uses a 21-day window and applies to Business; those values are not interchangeable. Differences in audience, version, state, unit, or time window are material. Reviewers reject the claim, preserve their rationale, and require the proposal owner to cite the authoritative subsection.

Changes to deployment eligibility scope, units, limits, regions, or lifecycle status follow a minimum 35-day communication window except for documented urgent security action. Customers receive a comparison of old and new rules plus migration instructions. Superseded language remains available for audit, and existing exceptions are reviewed without silently extending them.

Decision example 1. During a subscription review for a Virginia tenant, Customer Success compares the requested treatment of deployment eligibility with the current entitlement and live configuration. Approval is time-bounded to 7 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.

Decision example 2. A customer in Singapore changes an implementation parameter that may affect deployment eligibility. Platform Engineering verifies the version, plan, region, state, unit, and exclusion before answering the procurement team. A compliant result is reviewed again within 14 days. An unmet condition is classified as unavailable, custom, or exception-controlled, with the evidence and reasoning exposed to the customer.

Decision example 3. For a Sydney renewal, Product Operations must decide whether deployment eligibility can appear as a current commitment. The reviewer uses the signed scope and operational evidence instead of undocumented product knowledge. Acceptance lasts no more than 21 days before normal reassessment. If the baseline is not met, the response names the actual lifecycle state and the required next action.

Decision example 4. A mainland China tenant asks whether deployment eligibility remains contractually available after a configuration change. Security Assurance checks the effective guide, capability state, unit, and explicit exclusion. If every prerequisite is satisfied, the decision remains valid for 30 days before routine reassessment; otherwise it is recorded accurately as unavailable, custom, or exception-bound. The customer-facing rationale links to evidence so another reviewer can reproduce the decision.

Decision example 5. During a subscription review for a Frankfurt tenant, Regional Reliability compares the requested treatment of deployment eligibility with the current entitlement and live configuration. Approval is time-bounded to 35 days and includes the governing evidence. Missing prerequisites are reported as a gap rather than silently elevated to standard support, allowing a later reviewer to repeat the same decision from recorded facts.
